# Automated Uniform Storage and Retrieval Conveyor System

## Uniform Storage for Casinos, Hotels and Hospitals

Managing the day to day storage and retrieval of employee uniforms in large hospitals, hotels, casinos, resorts and amusement parks can be a challenge. Each employee needs to have quick and easy access their own assigned uniform and the clothing must be stored and delivered in a way that maintains the fresh, neat and tidy look of each garment.

PACLINE's automated uniform storage and retrieval conveyor offers an excellent uniform delivery system that maximizes storage capacity of hanging garments. PACLINE utilizes an enclosed track overhead conveyor system that takes advantage of space above the normal reach for storage and eliminates the need for access aisles, since the clothing items can be brought to a desired location for loading or unloading.

The PACLINE system can be designed to meet various levels of automation based on your particular needs and budget.

## Key features of the PACLINE automated uniform conveyor system:

- Storage of a large number of uniform items in a limited space.
- Automatic retrieval of garments by employees - using the Employee ID Card as a method of identification.
- Flexibility with RFID tags, barcodes and man-readable labels.
- Tracking and monitoring of each uniform piece using the latest UHF (Ultra-High Frequency) RFID technology.
- Minimizes manual labor.
- Systems can be customized for degree of automation required.
